

Database Systems Lab – Project Proposal

1. Objective of the Proposal:

The purpose of this proposal is to clearly define the problem of inefficient internship management in educational institutions and to propose a structured software solution. The system to be developed is a Smart Internship Management System, which will centralize and automate internship-related processes.

This project focuses on designing and implementing a database-driven system that efficiently stores, manages, and retrieves data related to students, companies, internships, applications, and evaluations. The primary emphasis is on database design, relationships, and data integrity.

2. Project Team Information:

Student 1 Name: Munazza Sana | Program & Group: BSCS-A

Student 2 Name: Zameen Qasim | Program & Group: BSCS-A

Project Title:

“Smart Internship Management System”

3. Introduction & Background:

Internships play a vital role in bridging the gap between academic learning and professional experience. However, many institutions still rely on manual or semi-digital systems such as emails and spreadsheets to manage internship processes. These methods are often inefficient, unorganized, and prone to errors.

A centralized system is needed to streamline communication, organize data, and automate workflows. By implementing a database-driven internship management system, institutions

can significantly improve efficiency, transparency, and accessibility of information for all stakeholders.

4. Problem Statement:

In the current real-world scenario, internship management lacks a centralized and efficient system.

- Internship processes are handled manually or through scattered systems
- Applications get lost or delayed
- Lack of transparency in selection process
- Difficulty in tracking student progress
- Poor communication between stakeholders
- Data redundancy and inconsistency

A database solution is required to store structured data, ensure consistency, and enable fast retrieval and updates.

5. Proposed Solution:

The proposed solution is a Smart Internship Management System, a web-based platform that connects students, companies, and administrators in one centralized system.

The system will allow students to apply for internships, companies to post opportunities, and administrators to manage and monitor the entire process. It improves efficiency by automating workflows and ensuring transparency.

6. Objectives of the System:

- Efficient management of internship data
- Ensure data consistency and integrity
- Provide fast data retrieval and updates
- Improve communication between stakeholders
- Enable transparent selection process
- Track student progress digitally

7. Scope of the Project:

Included:

- Student registration and profile management
- Internship posting
- Application tracking
- Admin approval system
- Feedback system

Excluded:

- AI-based features
- External integrations
- Mobile application

8. Role of Database System:

The database is the core component of this system

Data Stored:

- Student details
- Company details
- Internship postings
- Applications
- Feedback and evaluations

Why Database is Necessary:

- To manage large structured data efficiently
- To ensure accuracy and avoid duplication
- To provide fast querying and updates

Operations:

- CRUD operations (Create, Read, Update, Delete)
- Searching internships and applicants
- Generating reports

Data Integrity:

- Use of primary and foreign keys
- Constraints to avoid invalid data
- Relationships to maintain consistency

9. System Features / Functional Requirements:

- User registration and login
- Student profile management
- Internship search
- Application submission
- Company posting system
- Applicant review
- Admin approval
- Application tracking
- Feedback system
- Notifications

10. Preliminary Data Design:

Entities:

Students, Companies, Internships, Applications, Feedback

Relationships:

- A student can apply to multiple internships (One-to-Many)
- A company can post multiple internships (One-to-Many)
- An internship can receive multiple applications (One-to-Many)
- Each application is linked to one student and one internship (Many-to-One)
- Feedback is associated with both students and companies

11. Existing Systems / Comparative Analysis:

Currently, internship management in many institutions is handled through emails, spreadsheets, or manual processes.

Limitations of Existing Systems:

- No centralized database
- High risk of data loss and errors
- Lack of transparency
- Time-consuming processes

Improvements in Proposed System:

- Centralized and organized data management
- Automated workflows
- Improved accuracy and consistency
- Real-time tracking and communication

12. Proposed Technology Stack:

Frontend: HTML, CSS, JavaScript

Backend: Flask or PHP

Database: MySQL

Tools: VS Code, XAMPP, MySQL Workbench

13. Expected Outcomes:

The Smart Internship Management System will:

- Provide an efficient and centralized platform for internship management
- Reduce manual workload and errors
- Improve communication between all users
- Ensure transparency and fairness in the process
- Maintain a structured and reliable database system
- Enhance the overall internship experience for students and companies
